(4) How agent collaboration works

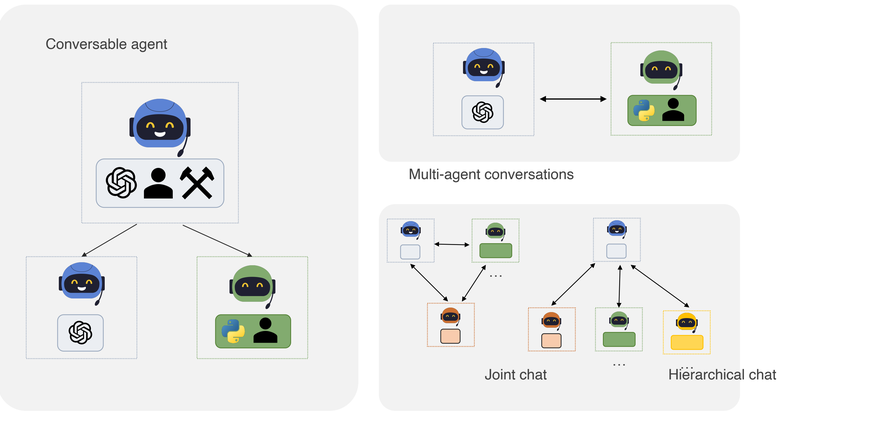

What Is AutoGen?

AutoGen is an open-source framework designed to develop and coordinate AI agents for solving complex tasks efficiently.

It offers a flexible and user-friendly platform for agentic AI development, similar to how PyTorch accelerates deep learning.

It supports inter-agent communication, LLM integration, and tool-based workflows, enabling autonomous and human-in-the-loop collaboration.

Multi-Agent Framework

Autogen Agent Types

AutoGen provides various types of agents, each designed for specific roles in multi-agent collaboration.

UserProxyAgent

It represents human users and facilitates interactive workflows.

AssistantAgent

It is core AI agent that interacts with LLMs to generate responses.

GroupChatManager

It orchestrates structured communication between multiple agents.

CodeExecutorAgent

It executes AI-generated code to enable tool-based tasks.
